

RAAFINDRA WAHYU PRATAMA

Cloud & DevOps Infrastructure Engineer | Linux Enterprise | Terraform & IaC | Production Operations

Indonesia | [+6285274126094/+6285780593428] | [Raafindra.work@gmail.com] | LinkedIn:
[https://www.linkedin.com/in/raafindrawp/] | GitHub: [https://github.com/raafindra]

PROFESSIONAL SUMMARY

Results-driven Systems & Cloud Infrastructure Engineer with 8+ years of enterprise experience supporting mission-critical telecom environments (Indosat Ooredoo Hutchison) across TechMahindra, Kyndryl, and IBM. Proven expertise in enterprise Linux administration, Python/Shell automation, and modern Infrastructure as Code (Terraform) on AWS. Skilled in architecting multi-tier high-availability systems, containerized environments (Docker), and automated production operations with zero-downtime standards.

CORE TECHNICAL SKILLS

Cloud & Infrastructure as Code:

AWS (VPC, EC2, ALB, Auto Scaling, RDS PostgreSQL, S3, DynamoDB) | Terraform (Modular Architecture, Remote State, State Locking)

Operating Systems & Scripting:

Enterprise Linux (Ubuntu, RHEL/CentOS) | Shell Scripting (Bash) | Python Automation | Windows Server

Containerization & Orchestration:

Docker | Docker Compose | Container Networking | Persistent Volumes | Kubernetes (Basic)

CI/CD & DevOps Tools:

Git | GitHub | Jenkins | CI/CD Concepts

Monitoring & Production Operations:

Grafana | Log Management | Incident Investigation | System Health Checks | Production Support | Troubleshooting

Networking & Protocols:

TCP/IP | DNS | HTTP/HTTPS | Network Troubleshooting

Database & Middleware:

PostgreSQL | Oracle SQL | MySQL | SQL Server | Oracle WebLogic

PROFESSIONAL EXPERIENCE

TechMahindra Indonesia

System Engineer | June 2023 – Present

- Support high-reliability enterprise solutions in a production environment for Indosat Ooredoo Hutchison.
- Support Linux/Unix-based environments, application services, middleware components, and operational infrastructure.
- Perform system analysis, systems integration, testing, troubleshooting, log management, and incident investigation.
- Troubleshoot production incidents and coordinate with L1 and L3 teams to implement temporary and permanent solutions.
- Develop Shell and Python automation to reduce repetitive operational tasks.
- Perform operational monitoring and investigate system/application issues using logs and monitoring tools.

Kyndryl Services Indonesia

System Engineer | June 2022 – June 2023

- Supported high-reliability enterprise solutions for **Indosat Ooredoo Hutchison** in a production-oriented environment.
- Performed **technical analysis, systems integration, product installation, testing, troubleshooting, and log management**.
- Investigated operational incidents and coordinated with **L1 and L3 teams** to identify root causes and implement appropriate resolutions.
- Developed **Shell and Python automation** for repetitive operational activities.
- Supported application and infrastructure components to maintain service reliability and operational continuity.
- Performed Salesforce administration and related operational support.

PT JTI IBM

System Engineer | June 2020 – June 2022

- Supported high-reliability enterprise systems for **Indosat Ooredoo Hutchison**.
- Performed technical activities covering **system analysis, solution design, development, product installation, systems integration, testing, troubleshooting, and log management**.
- Coordinated with **L2 and L3 teams** to investigate escalated incidents and deliver temporary or permanent solutions.
- Developed automation using **Shell scripting and Python** to improve operational efficiency.
- Developed and maintained **monitoring dashboards and technical documentation using MkDocs**.
- Supported day-to-day enterprise application and infrastructure operations.

PT Indocyber Global Technology

Software Developer | October 2017 – June 2020

- Developed and maintained **financial and loan calculation systems**, including FOS and T24-related applications.
- Implemented application logic changes, API screens, and **E-KTP integration systems**.
- Developed and maintained web applications for employee management and monitoring using **HTML, JavaScript, AJAX, .NET, SQL Server, and K2**.
- Developed data collection systems for loan applications involving property guarantees.
- Supported application maintenance, enhancement, troubleshooting, and system improvement activities.

SELECTED CLOUD & DEVOPS PROJECTS

AWS Multi-Tier High-Availability Infrastructure (IaC with Terraform)

Terraform | AWS (VPC, ALB, ASG, RDS) | S3 & DynamoDB Remote State | Nginx

- Designed and provisioned an automated 3-tier enterprise architecture across multiple Availability Zones in AWS using modular Terraform.
- Configured robust remote state management using Amazon S3 with server-side encryption and distributed state locking via DynamoDB to prevent concurrent pipeline conflicts.
- Built a self-healing compute tier utilizing Auto Scaling Groups (ASG) and Launch Templates fronted by an Application Load Balancer (ALB) with automated health check routing.

- Enforced network segmentation and least-privilege security by isolating Amazon RDS PostgreSQL inside Private Subnets, strictly chained to accept inbound traffic only from application security groups.

PaySecure Microservices Deployment & Orchestration (Terraform, Docker & Kubernetes)

Terraform | Kubernetes | Docker | Microservices | Networking

- Designed and provisioned microservices infrastructure using modular Terraform configurations with isolated network architectures.
- Packaged multi-tier application workloads with production-grade Dockerfiles, optimizing image layers, persistent volumes, and non-root security.
- Deployed containerized microservices to a local Kubernetes cluster, defining declarative manifests for Deployments, ClusterIP/NodePort Services, ConfigMaps, and Secrets.
- Verified service discovery, pod auto-recovery, persistent storage mapping, and inter-service communication across microservice tiers.

Linux Server Health Check Automation

Bash | Linux | Cron | System Monitoring | Automation

- Developed a modular, Bash-based health check automation scheduled via Cron to continuously monitor server metrics (disk, memory) and core services (SSH, Cron, Docker).
- Designed an aggregated validation engine using standard exit codes (0 for healthy, 1 for unhealthy) to enable seamless integration with upstream monitoring systems.
- Implemented structured system logging capturing ISO timestamps, hostnames, severity levels, and holistic operational status for efficient triage and auditing.

EDUCATION

Bachelor of Computer Engineering | Andalas University | GPA: 3.15 / 4.00 | Graduated: 2017

CERTIFICATIONS & PROFESSIONAL DEVELOPMENT

AWS Cloud Engineering (In Progress) | Linux System Administration & Bash Automation | Docker & Containerization | Cloud Infrastructure & DevOps

LANGUAGES

Indonesian (Native) | English (Professional Working Proficiency)
